                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RI DIMENDAL-LAIL TELIBLE-1003).

RET Mech. Dev. 120:1139-1151(2003).

LIFE TOWCTION: Pair-rule protein that determines both the size and polarity of even-numbered as well as odd-numbered parasegments during embryogenesis. DNA-binding transcription factor that acts during embryogenesis. DNA-binding transcription factor that acts primarily as a transcriptional repressor but can also function as a transcriptional activator, depending on the stage of development and spatial restrictions (By similarity). May function redundantly with odd and drm in leg joint formation during the larval stages, acting downstream of Notch activation.

LISSUE SPECIFICITY: Has two temporally distinct modes of expression during early embryogenesis; expressed in seven stripes at the blastoderm stage. Also expressed in a non-periodic domain at the anterior of the embryo. During gastrulation, the seven primary stripes are supplemented by seven secondary stripes that appear in alternate segments. This results in the latensity at appear in alternate segments in the avenage, gaining in intensity at gastrulation. Expressed in the invaginating stomodeum and proctodeum of the embryonic gut. By stage 13, expressed in the region that will form the partogentic supplementally engage 13, expressed in the region that will form the pathyonic gut. By stage 13, expressed in the gut through the remainder of embryogenesis. Expressed has pattern in the leg disk at the distal edge of each presumptive leg segment in the lasts and pharmane and pattern in the leg disk at the distal edge of each presumptive leg segment and segment all edge of each presumptive leg segment and segment and pharmane event in target and segments and pharmane event in the areal segments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Copyrighted by the UniProt Consortium, see http://www.uniprot.org/terms Distributed under the Creative Commons Attribution-NoDerivs License

Also expressed in adult testis. In embryonic brain, expressed in a subset of postmitotic neurons generated posterior to the midbrain-hindbrain border. In the developing spinal cord, selectively expressed in dorsal horn interneurons. SIMILARITY: Belongs to the SKI family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Missing (in isoform 3).

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                      developmental biology; cell signalling; insecticide;

                                                                                                 à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an isolated MHC class II compound (I)

comprising: (a) an MHC class II component comprising at least a portion

comprising: (a) an MHC class II component comprising at least a portion

of an MHC class II alpha chain and MHC class II beta

chain form a peptide binding groove; (b) a spaceholder molecule; and (c)

an effector component, where the effector component is linked to the MHC

class II component. Also described: (I) a pharmaceutical composition

comprising the MHC class II molecule and a carrier; (2) a method of

producing an MHC class II compound; (3) a method of directly identifying

an antigen-specific T cell; (4) a method of directly identifying

an autigen-specific T cell; (4) a method of tracting an immune response ex vivo in a subject;

(6) a method of regulating an immune response ex vivo in a subject; and

(7) a method of treating an immune disorder ex vivo in a subject; and

(7) a method of treating an immune disorder ex vivo in a subject;

(1) can be used for preparing a composition for treating immune

cativities, and can be used in gene therapy. The MHC class II compound

(I) can be used for preparing a composition for treating immune

cativities, neoplastic disease, autoimmunity or tractions, parasitic

infections, neoplastic disease, autoimmunity or tractions, parasitic

an MHC class II compound from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                               MHC class II compound; MHC class II component; MHC class II alpha chain; MHC class II beta chain; peptide binding groove; spaceholder molecule; effector component; immune response; immune disorder; virucide; antibacterial; antiparasitic; cytostatic; immunosuppressive; gene therapy; viral infections; bacterial infection; parasitic infection; neoplastic disease; autoimmunity; toxicity; human.

```
New nucleic acid molecule encoding a hyperimmune serum reactive antigen, useful for the manufacture of a vaccine against Streptococcus agalactiae
                                immune stimulation; antigen; bacterial surface display; hyperimmune serum reactive antigen; vaccine; bacterial infection; antibacterial; infection.
S agalactiae hyperimmune serum reactive antigen seqid 326.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 12; SEQ ID NO 326; 221pp; English.

                                                                                                                                                                                 18-NOV-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  infection.
The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN6604-ABN71256 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to recombinantly produce (I) and may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                  Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antiinflammatory; infection; vaccine; meningitis; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò

The invention describes an isolated nucleic acid molecule encoding a hyperimmune serum reactive antigen or its fragment. Also described are: a vector comprising the nucleic acid molecule; a host cell comprising the vector comprising the nucleic acid molecule and comprising a sequence corocating the nucleic acid molecule and consisting of e.g., 85, 299, 467 consisting of peptides comprising e.g., 76, 134, 221 or 576 amino acids; consisting of peptides comprising e.g., 76, 134, 221 or 576 amino acids; a process for producing a Streptococcus agalactiae hyperimmune serum reactive antigen; a process for producing a cell that expresses a S. agalactiae hyperimmune serum reactive antigen; a pharmaceutical composition, especially a vaccine, comprising the hyperimmune serum composition, especially a vaccine, comprising the hyperimmune serum composition, especially a vaccine, comprising the hyperimmune serum control antibody; an antigonist that binds to the hyperimmune serum-reactive antigen; a method for identifying an antigonist capable of binding to the hyperimmune serum-reactive antigen; a method for identifying an antagonist capable of reducing or inhibiting the interaction activity of antagonist capable of reducing or inhibiting the interaction activity of a process for in vitro diagnosis and process for in vitro diagnosis of the hyperimmune serum-reactive antigen; and a process for in vitro diagnosis of the hyperimmune serum-reactive antigen; and a process for in vitro diagnosis of the hyperimmune serum-reactive antigen; and a process for in vitro diagnosis of the hyperimmune serum-reactive antigen; and a process for in vitro diagnosis of the hyperimmune serum-reactive antigen; and a process for in vitro diagnosis of the hyperimmune serum-reactive antigen; and a process for in vitro diagnosis of the hyperimmune serum-reactive antigen; and a process for in vitro diagnosis of the hyperimmune serum-reactive antigen; and a process for in vitro diagnosis of the hyperimmune serum-reactive antigen; and a process for in vi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hyperimmune serum reactive antigen is useful for isolating, purifying and/or identifying an interaction partner of the hyperimmune serum reactive antigen. The hyperimmune serum reactive antigen is useful for generating a peptide binding to the hyperimmune serum reactive antigen, where the peptide comprises anticalines, or for the manufacture of a functional nucleic acid comprising aptamers or spiegelmers. The nucleic acid molecule is useful for the manufacture of a functional ribonucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     acid comprising ribozymes, antisense nucleic acids or siRNA. The nucleic acid molecule, hyperimmune serum-reactive antisen or antibody is useful for the manufacture of a vaccine against S. agalactiae infection. This ithe amino acid sequence of a Streptococcus agalactiae hyperimmune serum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

The present invention relates to novel Streptococcus agalactiae

nucleotide sequences (1; ADV78860-ADV78998 and ADV83341-ADV85476) and

nucleotide sequences (1; ADV78899-ADV81203 and ADV812054ADV83340). The

convel polypeptides (11; ADV78899-ADV81203 and ADV81205-ADV83340). The

concleotide sequences encode polypeptides of S. agalactiae involved in the

concleotide metabolism, cell membranes, intermediate (central)

concleotide metabolism including purines, pyrimidines and/or nucleosides,

concleotide metabolism including purines, pyrimidines and/or nucleosides,

crequlatory functions, replication, transcribtion, translation, protein

transport, adaptation to atypical conditions, sensitivity to medicines

confactors, prosthetic groups and transporters, cell membrane proteins and

cofactors, prosthetic groups and transporters, cell membrane proteins and

cofactors, prosthetic groups and transporters, cell membrane proteins

cof nucleic acids. Pharmaceutical composition comprising (1) or (11) are

of nucleic acids. Pharmaceutical composition comprising (1) or (11) are

cof nucleic acids. Pharmaceutical composition comprising (1) or (11) are

cof nucleic acids. Pharmaceutical composition comprising (1) or (11) are

cof nucleic acids. Pharmaceutical composition of comprising (1) or (11) are

present patent is an equivalent for the basic patent FR2824074A1, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chips and identification of therapeutic targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Frangeul L, Lalioui L;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel Streptococcus agalactiae
nucleotide sequences (I; ADV87607-ADV87745) and novel polypeptides (II;
ADV87746-ADV8950). The nucleotide sequences encode polypeptides of S.
agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism including putnines, comprising and/or nucleosides, regulatory functions, replication, transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related conditions, sensitivity to medicines and/or analogues, functions related transpoorts, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids.
Pharmaceutical composition comprising (I) or (II) are useful for the detectial S. agalactiae infection. Note: WO20029818A2 is equivalent for the present basic patent FR2824074A1. WO200292818A2 contains 6617 sequence whereas the present patent only contains 2344
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chips and identification of therapeutic targets.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded protesins (ABB37737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             osteopathic; vulnerary; cytostatic; gene therapy; diagnosis; forensics; gene mapping; mutation identification; biodiversity; chromosome marker; immune response; myeloid cell disorder; lymphoid cell disorder; bone cartilage; tendon; ligament; nerve tissue growth; wound healing; burns; incision; ulcer; cancer.
                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel Streptococcus agalactiae

nucleotide sequences (1, ADV78860-ADV78998 and ADV83341-ADV85476) and

nucleotide sequences (1; ADV78899-ADV81203 and ADV81205-ADV83340). The

nucleotide sequences encode polypeptides of S. agalactiae involved in the
synthesis of amino acids, cell membranes, intermediate (central)

mucleotide metabolism including purines, pyrimidines and/or nucleosides,
regulatory functions, replication, transcription, translation, protein

transport, adaptation to atypical conditions, sensitivity to medicines

and/or analogues, functions related to transposons, biosynthesis of
cofactors, prosthetic groups and transporters, cell membrane proteins and
cellular machinery. (1) are useful for the detection and/or amplification
of nucleic acids. Pharmaceutical composition comprising (1) or (11) are
useful for treatment of a bacterial S. agalactiae infection. The complete
genome of Streptococcus agalactiae is given in ADV81204. Note: The
present patent is an equivalent for the basic patent FR2824074Al, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                    Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chips and identification of therapeutic targets.

New polynucleotides and secreted proteins, useful for treating myeloid or lymphoid cell disorders, in bone cartilage, tendon, ligament and nerve tissue growth or regeneration, in wound healing, and in tissue repair and replacement

Claim 20; SEQ ID NO 173; 243pp; English.

The invention relates to novel isolated polymucleotides or a sequence encoding a polypeptide with biological activity, where the polymucleotide corrections to the polymucleotide under stringent hybridization conditions or has greater than 99% sequence identity with the polymucleotide. The corresponding identification of mutations responsible for genetic gene mapping, identification of mutations responsible for genetic consources or supplements. The polymucleotides may also be used as molecular sources or supplements. The polymucleotides may also be used as molecular cources or supplements. The polymucleotides may also be used as molecular cources or supplements. The polymucleotides may also be used as molecular corresponding polypeptides or elicit immune response. The polympoptide is expressed, for re-engineering collophypeptide is expressed, for re-engineering collophypeptide is expressed, for re-engineering continguation, in wound healing myeloid or lymphoid cell corresponding polypeptide is proved and regeneration, in wound healing, in tissue repair and replacement, in the corresponds to a protein sequence of the invention.

New polynucleotides isolated from plants encoding transcription factors, and polypeptides encoded by such polynucleotides, useful for regulating gene transcription and gene expression.

This invention relates to novel isolated plant nucleic acid molecules, or variants thereof, that encode transcription factors. Specifically, it refers to transcription factor proteins that are capable of binding to no refers to regulate gene transcription and gene expression in a plants, in particular Eucalyptus grandis and Pinus radiata. The present invention describes DNA constructs containing DNA encoding a present containing DNA encoding a ranscription factor that regulates the promoter, which is operably linked to the desired nucleic acid to be expressed. It further provides transgenic plants expressing a transcription factor that confers a trait to the plant such as increased drought, salt or disease tolerance, height changed; enhanced cold/ frost tolerance, enhanced color, health and characteristics, as well as improved taste, starch composition, flower longevity and germination, amongst others.

CC Accordingly, such plants that are successfully transfected with a DNA construct can be characterized by a difference in flower color, petal or transcription factor protein sequence of the invention. ö transgenic; plant; enhanced tolerance to abiotic stress; glyphosphate tolerance; hormone sensitivity; disease resistance; sugar sensing; flower structure; stem bifurcation; branching pattern; apical dominance; trichome; stem morphology; root growth; root hair; seed development; call proliferation; call differentiation; premature senescence; necrosis; plant size; leaf morphology; seed morphology; seed biochemistry; root anthocyanin; plant anthocyanin; lapht response; shade avoidance; bioinformatic; Gaps ö Score 39; DB 9; Length 311; Pred. 04-MAR-2004
    The invention describes a transgenic plant comprising a recombinant bolynucleotide of any one of more than 500 nucleotide sequences fully defined in the specification or its complement. The method of the invention can be used to produced a plant having altered traits such as: chhanced tolerance to abiotic stress; glyphosphate tolerance; hormone sensitivity; disease resistance; sugar sensing; early or late flowering; altered flower structure, change in steem bifurcations, altered branching pattern, reduced apical dominance, reduced trichome density; lack of trichomes; reduced trichome development; altered trichome trichome trichome number; altered stem morphology; increased root growth, increased root hairs; altered seed development; altered cell proliferation or cell differentiation; rapid development; premature senescence; increased necrosis; increase in seedling or plant or size; decreased plant size; leaf morphology; seed morphology; seed size; decreased plant size; leaf morphology; seed morphology; seed coloments, increase in remarkable transgenic plant, polynucleotides and polypeptides are useful in blonk bloinformatic search methods. This is the amino acid sequence of a plant transcription factor, and an orthologue of Arabiodopsis thaliana transcription of a transgenic plant with altered traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

```
polynucleotide having a polynucleotide sequence or its complementary sequence comprising a sequence encoding a polypeptide, that initiates transcription (i.e. a transcription factor) from Arabidopsis, Soybean, Rice, Rape or Corn, comprising any of the sequences appearing as AD001588 -AD003527 or AD003530-AD003559. Also included are using a transgenic plant to grow a progeny plant, an expression cassette (comprising a constitutive, inducible or tissue-specific promoter and a recombinant polynucleotide described above), a host cell comprising the expression cassette, producing a modified plant having a modified trait, identifying a factor that is modulated by or interacts with a polypeptide encoded by the polynucleotide sequence and identifying at least one downstream polynucleotide sequence that is subject to a regulatory effect of any of the polypeptides encoded by the polynucleotide described above. The transgenic plant is useful for producing a plant that has an altered transgenic plant is useful for producing a plant that has an altered transgenic plant, enhanced tolerance to abiotic stress (increased tolerance to chilling, germination in cold conditions, freezing tolerance to theat, tolerance to semotic stress, tolerance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New transgenic plant, useful in developing phenotypes with altered or improved characteristics or traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a transgenic plant comprises a recombinant

The present invention relates to novel plant transcription factor proteins (I) and nucleotide sequences (II) (ADO61394-ADO6379). The equences can be used to produce transgenic plants, which overexpress (II), where the transgenic plant has an altered trait as compared to a not-transgenic plant or wild-type plant. The transgenic plant comprises an altered trait selected from increased tolerance to abiotic stress, increased tolerance to cold, increased tolerance to disease, increased tolerance to cold, increased tolerance to disease, including increased tolerance to disease, including town phosphate conditions, increased tolerance to disease, including town multiple fungal pathogens, increased tolerance to disease, including town multiple fungal pathogens, increased tolerance to glyphosate, increased sensitivity to ABC, altered sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity to ABC, altered sensitivity to ABC, altered sensitivity to ABC, altered sensitivity to ABA, reduced sensitivity to ABC, altered sensitivity to ABA, reduced sensitivity to ABC, altered sensitivity to ABA, reduced sensitivity to ABC, altered sensitivity to ABC, altered sensitivity to ABC, altered sensitivity to ABC, altered sensitivity altered flower structure, leared trichome structure, altered sensitivity, altered benefit, altered seed trichome structure, altered obsent, altered benefit, altered benefit, altered seed trichome structure, altered coll expension, altered benefit, altered call proliferation, altered coll expension, altered call proliferation, altered cell expension, altered cell proliferation, altered cell expension altered cell proliferation, altered seed latered sension or gray leaves, glossy leaves, altered abaxial/adaxial polarity, green leaves, glossy leaves, altered abaxial/adaxial polarity, and content, altered seed protein content, altered seed and mass, large 
                                                                                                       New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to novel abiotic stress responsive polynucleotides and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, salt stress, osmocic stress cany of their combinations. The present sequence is used in the exemplification of the invention
                                                                                                                           responsiveness of a plant, e.g. cereal, to an abiotic stress such as cold stress, salt stress or osmotic stress.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MHC class II compound; MHC class II component; MHC class II alpha chain; MHC class II beta chain; peptide binding groove; spaceholder molecule; effector component; immune response; immune disorder; virucide; antibacterial; antiparasitic; cytostatic; immunosuppressive; gene therapy; viral infections; bacterial infection; parasitic infection; neoplastic disease; autoimmunity; toxicity; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present invention describes an isolated MHC class II compound (I) comprising: (a) an MHC class II component comprising at least a portion of an MHC class II alpha chain and at least a portion of an MHC class II alpha chain and mHC class II beta of action form a peptide binding groove; (b) a spaceholder molecule; and (c) an effector component, where the effector component is linked to the MHC class II molecule and a carrier; (2) a method of producing an MHC class II molecule and a carrier; (2) a method of producing an MHC class II compound; (3) a method of directly identifying an antigen-specific T cell; (4) a method of regulating an immune response ex vivo in a subject; (5) a method of treating an immune disorder in a subject; and (7) a method of treating an immune response ex vivo in a subject; and (7) a method of treating an immune disorder and immunosuppressive activities, and can be used in gene therapy. The MHC class II compound (1) can be used for preparing a composition for treating immune catcions, parasitic disorders, e.g., viral infections, bacterial infections, parasitic infections, parasitic infections, parasitic infections, parasitic and infections, parasitic and infections, parasitic and memore represent sequence represents a spaceholder molecule peptide, which can be used in an MHC class II compound from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Buchrieser C, Frangeul L, Couve E, Rusniok C, Fsihi H, Dehoux P; Dussurget O, Chetouani P, Nedjari H, Glaser P, Kunst F, Cossart P; Daniels J, Goebel W, Kreft J, Kuhn M, Ng E, Vazquez-Boland JA; Dominguez-Bernal G, Garrido-Garcia P, Tierrez-Martinez A, Amend A; Chakraborty T, Domann E, Hain T, Berche P, Charbit A, Durant L; Perez-Diaz J, Baquero F, Garcia Del Portillo F, Gomez-Lopez N; Maduenio E, De Pablos B, Wehland J, Kaerst U, Entian K, Hauf J; Rose M, Voss H;
treating immune disorders e.g. viral infections, bacterial infections, parasitic infections, neoplastic disease, autoimmunity or toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibacterial; gene therapy; vaccine; biosynthesis; biodegradation; vitamin B12; bacterial infection; disease.

The present invention relates to the genome sequence of Listeria

monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of
it are useful for selecting probes and primers for detecting genes in L.

monocytogenes and related organisms, and for studying genetic
comportogenes and related organisms, and for studying genetic
comportogenes and related organisms.

CC expressed from the genome sequence are useful for raising specific
cantibodies, identification of L. monocytogenes and related organisms, and
cfor biosynthesis and biodegradation, especially biosynthesis of Vitamin
CC for biosynthesis and biodegradation, especially biosynthesis of Vitamin
CC selecting compounds that regulate gene expression and cell replication
CC selecting compounds that regulate dene expression and cell replication
CC and modulate L. monocytogenes-related diseases. In addition, the genome
CC vaccines compositions for the treatment or prevention of infections by L.
CC monocytogenes and related organisms. Note: The sequence data for this
CC patent did not form part of the printed specification, but was obtained
CC in electronic format directly from NIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
Genomic sequence for Listeria monocytogenes, useful e.g. for treatment and prevention of Listeria and related bacterial infections, and related polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Drosophila; developmental biology; cell signalling; insecticide; pharmaceutical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a polypeptide (PP) having receptor-like protein kinase activity, mitogen activated protein (MAP)-kinase activity, LIPI5-like transcription factor activity, caleosin-like activity, ATP citrate lyase activity, SNF1-like activity and CKC-like transcription factor activity and CKC-like transcription factor activity. Also described: (1) complement (II) of (I); (2) a chimeric construct (III) comprising (I) or (III), operably linked to a regulatory sequence; (3) a plant (IV); and (5) comprising (III) in its genome; (4) seeds (V) obtained from (IV); and (5)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel nucleotide fragment encoding polypeptides having receptor-like protein kinase activity, caleosin-like activity, useful for altering oil phenotypes in plants such as sunflower, coconut, soybean, wheat and rice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            B;
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Epelbaum S, Famodu OO, Harvell LT;

Also disclosed are vectors, expression cassettes, host cells, and plants containing such polymucleotides. Also disclosed are methods for using the polymucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polymucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polymucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, salt stress, osmotic stress c any of their combinations. The present sequence is used in the exemplification of the invention
oil obtained from (V). (I) or its part can be used in antisense inhibition or co-suppression in a transformed plant. (III) is useful for altering the oil phenotype in a plant such as corn, soybean, wheat, rice, canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACCOOGS to ACCOOGS and ABR40591 to ABR40879 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cold
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel abiotic stress responsive polynucleotides

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense; prokaryotic essential gene; cell proliferation; drug design.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell, and a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest and for sEQ IDS 9692-16825 represent a group of 7134 Mxyococcus xanthus proteins and peptides. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                  the inventory issues of an interest acts to where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense another acid; (2) a host cell containing the vector; (3) an isolated concleic acid; (2) a host cell containing the vector; (3) an isolated containing the polypeptide of its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide (5) producing the polypeptide; (6) inhibiting cellular containing the polypeptide; (6) inhibiting cellular containing the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway contained for proliferation, or that inhibits cellular proliferation; (8) centured for cellular proliferation of an compound that inhibits proliferation of an compound that compound that inhibits proliferation of an compound; a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent compound; a ctivity; (11) a culture comprising strains in which the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the compound contains; or (13) identifying the target of a compound that inhibits the contained contains or screening for homologous nucleic acids required contains and activity; (13) activity of compound that inhibits cellular proliferation of an organism. The antisense nucleic acids are useful for cellular proliferation of an organism. The activity of acids are useful for cellular proliferation of an organism contains and acids are useful for cellular proliferation of an organism contains and acids are useful for cellular proliferation of an organism contai

or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiucher; vulnerary; anticonvulsant; antidacterial; antifugal; antiparasitic and cardiant activity. The polymucleotide and protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The nucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                isolation and characterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agonist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               disease, multiple scleroais, rheumatoid arthritis and ulcerative colitis; cardiovascular disorders such as myocardial ischaemias; wound healing; neurological diseases such as cerebral anoxia and epilepsy; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human breast and ovarian cancer associated gene sequences and the polypeptides encoded by these genes, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequences AAF21614 - AAF22031 represent DNA sequences encoding human proteins ABES9711 - AAB59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are sequences AAF22032 - AAF22040 and AAB59129 which are used in the
nootropic; neurpprotective; antiviral; antiallergic; hepatotropic;
antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant;
                                                                     antibacterial; antifungal; antiparasitic; cardiant; immune disorder; Addison's disease; allergy; autoimmune haemolytic anaemia; autoimmune thyroiditis; diabetes mellitus; Crohn's disease; amultiple sclerosis; rheumatoid arthritis; ulcerative colltis; cardiovascular disorder; wound healing; neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present invention relates to a novel recombinant DNA polynucleotide comprising a cell cycle regulated promoter, such as a cyclin promoter, that functions in plants operably linked to a DNA polynucleotide encoding an isopentenyl transferase. The present sequence is one such isopentenyl transferase. The present sequence is one such isopentenyl transferase. Also claimed are transgenic plants comprising the recombinant polynucleotide is useful for producing transgenic plants expressing cytckinin biosynthetic genes, and also provides an improved method of producing transgenic plants with increased yield and vigor. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics,
                                                                                             New recombinant DNA polynucleotide comprising a cell cycle regulated promoter and encoding an isopentenyl transferase, useful for producing transgenic plants expressing cytokinin biosynthetic genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bacterial infection; Pseudomonas aeruginosa infection; antibacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 37; DB 10; Length 455; Pred. No. 6e+02; t; Mismatches 0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to an isolated polynucleotide comprising a plant promoter directing transcription of an operably linked polynucleotide in at least one of the tissues selected from abscission zone, root, pod, wall, apical meristem, and flower of plants. The polynucleotides and methods are useful for producing a plant having increased yield or a trait of agronomic interest when compared to a nontransformed plant of the same genotype. The present sequence represents a IPP-like structural protein. The sequence data for this patent is not represented in the printed specification but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transgenic plant; plant breeding; isopentenyl transferase; enzyme; plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotides comprising a plant promoter that directs its transcription into abscission zone(s), root, pod, wall, apical meristem, or flower of plants, useful for producing a plant having increased yield
                                   abscission zone; apical meristem; Plant Growth Regulant; Gene Therapy; A6; abscission zone promoter; IPT; isopentyl transfease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology, Sequences ABO67826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid comprising any one of

the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway can equired for the gene required for cellular proliferation; (8) inchipits against a proliferation, or that inhibits cellular proliferation; (8) at gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; sactivity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MHC class II compound; MHC class II component; MHC class II alpha chain; MHC class II beta chain; peptide binding groove; spaceholder molecule; effector component; immune response; immune disorder; virucide; antibacterial; antiparastic; cytostatic; immunosuppressive; gene therapy; viral infections; bacterial infection; parastic infection, neoplastic disease; autoimmunity; toxicity; human.

The present invention describes an isolated MHC class II compound (I) comprising: (a) an MHC class II component comprising at least a portion of an MHC class II alpha chain and at least a portion of an MHC class II alpha chain and mHC class II beta cof an MHC class II alpha chain and MHC class II beta chain form a peptide binding groove; (b) a spaceholder molecule; and (c) an effector component, where the effector component is linked to the MHC class II component. Also described: (1) a pharmaceutical composition comprising the MHC class II molecule and a carrier; (2) a method of producing an MHC class II compound; (3) a method of directly identifying an antigen-specific T cell; (4) a method of treating an immune response ex vivo in a subject; (5) a method of treating an immune disorder in a subject; and (7) a method of treating an immune disorder and immunosuppressive corruction, and can be used in gene therapy. The MHC class II compound (I) can be used for preparing a composition for treating immune corructions, neoplastic disease, autoimmunity or toxicity. The present infections, neoplastic disease, autoimmunity or toxicity. The present confider and incompound from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cancer; tumour; cytostatic; immunostimulant; vaccine; gene therapy;

The invention relates to novel compositions and methods for the therapy and diagnosis of cancer, particularly lung cancer. The compositions comprise one or more lung tumour polypeptides, immunogenic portions therof, polynucleotides that encode such polypeptides, antigen presenting cells that express such polypeptides, and T cells that are specific for cells expressing such polypeptides. The novel compositions have oytostatic and immunostimulant activity. The lung tumour antigens can be used in the creation of a vaccine. The polynucleotides that encode the lung tumour polypeptides can be used in gene therapy to help in the reatment of lung tumours. This sequence represents a human lung tumour clone polypeptide of the invention. This sequence was not shown in the specification. It has been taken from a World Intellectual Property
and diagnosis of cancer, particularly lung cancer. The compositions comprise one or more lung tumour polypeptides, immunogenic portions therof, polynucleotides that encode such polypeptides, antigen presenting cells that expressing such polypeptides, and T cells that are specific for cells expressing such polypeptides. The novel compositions have expostatic and immunostimulant activity. The lung tumour antigens can be used in the creation of a vaccine. The polynucleotides that encode the lung tumour polypeptides can be used in gene therapy to help in the treatment of lung tumours. This sequence represents a human lung tumour clone polypeptide of the invention. This sequence was not shown in the specification. It has been taken from a World Intellectual Property Organization CD ROM supplied with the specification.

0
cells isolated from a patient with at least one component chosen from a polypeptide, polynuclectide or antigen presenting cell (APC) of the invention and administering an effective amount of the proliferated T cells to the patient. The current sequence is that of the human lung cancer-related peptide of the invention. The current sequence is not shown in the specification per se but is available on the USPTO web-site http:seqdata.uspto.gov/sequence.html?DocID=20030211510.

Sequence 148 AA;

```
The invention relates to a novel isolated polynucleotide comprising a sequence chosen from any one of 40 lung tumour polypeptides or its complements, fragments or degenerate variants. The method of the invention has cytostatic applications and may be useful for detecting and treating lung cancer in a patient, as well as for inhibiting the development of lung cancer in a patient via incubating CD4+ and/or CD8+ T cells isolated from a patient with at least one component chosen from a polypeptide, polynucleotide or antigen presenting cell (APC) of the invention and administering an effective amount of the proliferated T cells to the patient. The current sequence is that of the human lung cancer-related peptide of the invention. The current sequence is not cancer-related peptide of the invention. The current sequence is not the useful cancer is not the useful that it is available on the USPTO web-site http:seqdata.uspto.gov/sequence.html?DocID=20030211510.

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

Disclosure; SEQ ID NO 38739; 21pp + Sequence Listing; English

The invention relates a recombinant DNA construct comprising a CC polymucleotide having any of 5544 mucleotide sequences (CDNAs SEQ ID NO: 1-5544) and encoding a polypeptide with any of 5544 amino acid sequences (SEQ ID NO: 5545-11089). The CDNAs and proteins are from corn, soybean, capabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producting a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising a promoter region construct in a plant cell operably joined to a polynucleotide encoding a plant with a resombinant DNA construct comprising the transformed collypeptide associated with the property, and growing the transformed plant. The property is selected from improving plant cold tolerance, for plant. The property is selected from improving plant cold tolerance, for pathway, for improving plant drought tolerance, for providing increasing resistance to plant disease, for adactomannan production, for production of plant tolerance to herbicides, for increasing the rate of improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to pathogens or pests, for yield improvement by modification of carbohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by read improvement by and for uptake and for yield improvement by read improvement by modification of carbohydrate, nitrogen or phosphorus use and/or uptake

18 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16177) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

development under at least one stress condition. The polynucleotide may also encode a plant transcription factor. The methods and compositions of the present invention are useful in the field of biochemistry and genetics, in particular for producing transgenic plants with improved biological characteristics such as increased yield, improved nitrogen flow, increasing plant tolerance to cold or heat, improving plant tolerance to extreme osmotic and drought conditions, and improving plant tolerance to plant pests or pathogens. They can also be used in physical arrays of molecules, plant breeding markers, computer-based storage and analysis systems. The present sequence is one of the 5344 plant protein sequences of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in collectual format directly from USFTO at sequence content of the sequence of the s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant components for acidinosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to a new isolated lung specific nucleic acid

molecule (I) comprising any of 113 fully defined nucleotide sequences

given in the specification, their encoded protein sequences, sequences

given in the specification, their encoded protein sequences, sequences

compositions of the nucleotide sequences. The methods and

compositions of the present invention are useful for identifying,

compositions of the present invention are useful for identifying,

compositions of the present invention are useful for identifying,

conditions of the lung. They are also used for identifying lung

concerous diseases of the lung. They are also used for identifying lung

concerous diseases of the lung. They are also used for identifying lung

concerous diseases of the lung. They are also used for identifying lung

concerous diseases of the lung. They are also used for identifying lung

concerous diseases of the lung. They are also used for identifying lung

confined and invention, gene therapy, production of transgenic

animals and production of engineered lung tissue for treatment and

cresearch. Lung specific genes (LSGS) were identified by a systematic

conalysis of gene expression data in the LIFESEQ Gold database using the

construction of confider and the second promatic search program

(CLASP). Genes were grouped into gene bins where each bin is a cluster of

sequences grouped together where they share a common contig.

Differentially expressed tissue-specific genes were selected based on the
                                                                                                                                                                                                                      ö
of Pseudomonas species using biochip technology. Sequences ABO67826-
BAD64396 represent P. aeruginosa polypeptides of the invention. Note: The
Sequence data for this patent did not form part of the printed
specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung.
                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytostatic; gene therapy; vaccine; lung; diagnosis; cancer; non-cancerous lung disease; lung tissue; antagonist; gene therapy; transgenic animal; splice variant.

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
percentage level in the targeted tissue versus all the other tissues. The expression levels for each gene in libraries of normal tissues or non-tumour tissues from cancer patients were compared with the expression levels in tissue libraries associated with tumour or disease. This sequence represents a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more
genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                insecticides, therepoutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
New Stomach cancer-associated genes, useful as markers in blood tests for screening for the early stages of the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to stomach cancer-expressed genes (AAI93842-AAI93917) and the encoded proteins (AAM93967-AAM94039). The genes can be used as markers in blood tests for screening for the early stages of the disease. The proteins and peptides can be used as targets for screening for compounds to treat the disease. They can also be used for predicting micro-metastases. The gene can predict peritoneal dissemination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ota T, Isogai T, Nishikawa T, Hayashi K, Saito K, Yamamoto J;
